Abstract

Capturing natural emotions as they occur in the wild is a known challenge. Participant compliance is often low and often the most important events are not captured. We present a new application design for capturing emotional assessments in the wild, using phone based sensors to determine events of interest and to generate timely in situ prompts. We present a flexible design

that allows both quick assessments (less than 30s) and in depth journaling. The application is designed to be beautiful, engaging and informative while capturing rich data to inform insights and algorithms.

Introduction

Natural emotions occur in the wild, while we are mobile: driving, walking, standing, talking to our friends, having lunch, caring for our children. To capture in situ emotion annotations, we designed a mobile phone platform that allows us to capture important moments in our day without slowing us down or interfering with our primary tasks. Our user experience allows for flexible engagement in three tiers: a quick ecological momentary assessment (EMA) that combines aspects of both Russell's circumplex and categorical emotions; a free form long answer capability with both audio and text notes and longer surveys to get in depth information when the user has time.

Affective Computing

Is how systems and devices understand human emotion

Why?

To humanize interaction with computers

AI / deep learning needs more data to get started

Conclusion
